

NorthStar

AI-Powered Executive Visibility Operating System

PROJECT REVIEW DOCUMENT • V1.0 • MAY 2026

1. Project Overview

NorthStar is an AI-powered operational intelligence platform designed to reduce organizational meeting overload. It transforms conversational employee updates into executive-level visibility, operational analytics, delivery risk intelligence, and AI-generated business insights.

Mission Control for Organizational Operations: Instead of leadership attending multiple repetitive meetings, NorthStar provides centralized intelligence through automated summaries, project health tracking, and escalation detection.

2. Problem Statement

Modern organizations struggle with excessive status meetings and fragmented communication. Current tools like Jira, Slack, and Notion store data but fail to convert it into executive intelligence or proactive risk awareness.

- Delayed risk detection and hidden blockers.
- Low-quality executive reporting workflows.
- Cross-team coordination gaps as organizations scale.

3. Vision & Core Insight

NorthStar aims to become the **Operational Intelligence Layer** for modern organizations. The real innovation lies in AI-powered extraction: employees communicate naturally, and the AI converts those updates into structured signals.

4. Role-Based Access Control (RBAC)

CEO / Executive	Manager	Employee
Access to org-wide analytics, escalation radar, and AI	Access to assigned team analytics, health dashboards,	

executive briefings for strategic oversight.

blocker insights, and delivery metrics.

Low-friction conversational updates, response to AI prompts, and personal reporting history.

5. Key Features

Meeting Confidence Score

A proprietary indicator for each project to determine if human intervention is required:

- **GREEN** No Meeting Needed
- **YELLOW** Optional Sync
- **RED** Leadership Attention Needed

Escalation Radar

Automatically detects repeated blockers, "silent teams," unresolved dependencies, and low-confidence projects before they impact deadlines.

Adaptive AI Follow-Ups

The AI only asks missing questions based on the context of the initial update to ensure data completeness without friction.

6. Technical Architecture

Frontend: Next.js, Tailwind CSS, Framer Motion, Recharts.

Backend: Node.js, Express, PostgreSQL, Prisma ORM.

AI Stack: Ollama (Llama3) for development; GPT-4o/Claude/Gemini for production.

7. Success Criteria

- Updates completed in under **90 seconds**.
- Measurable decrease in status-only meeting hours.
- Proactive detection of blockers before weekly syncs.
- Executive summaries that drive immediate actionable decisions.
